Overview

Findings by chart

Which charts have violations, warnings, or unresolved diagnostics?

Testing time by chart

Which charts used the most time? Cells match the chart grid above.

Read left to right, then down. Cell numbers match the chart sections; -- means timing unavailable.

Each cell is one chart; both grids follow chart-section order. Click a cell in the PDF for details. Colors show the highest observed finding kind, not a security or business-impact score. Hatching marks unfinished or unavailable testing, even when a finding was recorded. No findings means none in the completed sample, not exhaustive coverage. Testing time excludes dependency preparation.

Scan summary

Git comparison: HEAD^ (ba7b5abc108e60d97302618dbcf21b2dc7d0b924); 0 cached chart successes reused.

Directory: /Users/emmadoyle/projects/personal/hypothesis-helm/.cache/bitnami-compiler-review-1789844100/charts

Started (Unix epoch): 1789844180

Elapsed (wall clock): 778.49 seconds

Chart testing: 777.82 seconds

Dependency preparation: 0.00 seconds (excluded from testing budgets)

Charts discovered: 3

Scan status: completed

Discovery complete: True

Unstarted charts: 0

Results record outcomes for the tested sample and selected checks.

Baseline-only, skipped, blocked, and incomplete charts retain their respective statuses.

Status counts

1 time-limit; 2 failed.

Settings

Filtering: True | Seed: 0 | Traversal: random

Chart timeout: 300.0 seconds | Workers: not recorded

Complete settings are retained in the JSON report.

Generated values use the configured input domains and any supported destination constraints.

Coverage excludes inputs outside these domains; supplied defaults are tested unchanged. The JSON report records constraints and unresolved mappings.

Disabled checks: HH2006

Errors

31 distinct diagnostics across 56 occurrences; 25 repeats grouped.

Diagnostics and their triggering inputs are grouped under each chart below.

Up to two examples per diagnostic and six fields per example are shown. Long values and diagnostics are shortened.

Full inputs, diagnostics, and remaining cases are retained in local run data.

Selected fields identify the inputs varied by the test. Causal attribution requires further investigation.
