Not tested

Testing unfinished / unavailable

Testing time by chart

Read left to right, then down. Cell numbers match the chart sections; -- means timing unavailable.

Each cell is one chart; both grids follow chart-section order. Click a cell in the PDF for details. Colors show the highest observed finding kind, not a security or business-impact score. Hatching marks unfinished or unavailable testing, even when a finding was recorded. No findings means none in the completed sample, not exhaustive coverage. Testing time excludes dependency preparation. Plot guide: [Overview matrices](#).

## Scan summary

Git comparison unavailable; no charts skipped using previous test results.

Results record outcomes for the tested sample and selected checks.

Baseline-only, skipped, blocked, and incomplete charts retain their respective statuses.

## Status counts

113 timeout; 1 skipped-library; 1 failed.

## Settings

Filtering: True | Seed: 0 | Traversal: random

Chart timeout: 8.0 seconds | Workers: 8

Complete settings are retained in the JSON report.

Command working directory: /Users/emmad Doyle/projects/personal/hypothesis-helm

Scan command:

```
hypothesis-helm test third_party/bitnami-charts --filter --disable-codes HH2006 --jobs 8 --chart-timeout 8s
--scan-timeout 16m --timeout 5 --max-examples 2 --seed 0 --shard none --max-mutations 8 --sensitivity-timeout
20s --pca-samples 8 --pca-timeout 10s --artifact-dir .cache/hypothesis-helm/bitnami-runs --report
docs/reports/bitnami.md --log-color
```

Generated values use the configured input domains and any supported destination constraints. Coverage excludes inputs outside these domains; supplied defaults are tested unchanged. The JSON report records constraints and unresolved mappings.

Disabled checks: [HH2006](#)

## Errors

114 distinct diagnostics across 114 occurrences; 0 repeats grouped.

Diagnostics and their triggering inputs are grouped under each chart below.

Up to two examples per diagnostic, with six fields each. Long values are shortened; YAML parser details stay in run data.

Full inputs, diagnostics, and remaining cases are retained in local run data.

Selected fields identify the inputs varied by the test. Causal attribution requires further investigation.

## Appendix: plot guide

### Overview matrices

Each numbered cell links to one chart. The left matrix shows findings or test status; the right shows recorded testing time. A dash means no timing was recorded. Incomplete and untested charts have not passed.

### Chart topology

Vertices represent values paths, branch conditions, templates and manifest fields. Connections show the relationships the compiler could establish between them. Rendered fields, when available, describe the measured baseline. An absent connection does not prove independence when analysis is incomplete.

### Field interactions

Both axes use the field numbers in the chart's sensitivity appendix entry, linked from its plot caption. Each measured cell compares changing two fields together with changing each separately from the same baseline. Manifests are encoded as path-and-value indicators, including empty containers. The color measures the sum of absolute differences in  $f(ij) - f(i) - f(j) + f(0)$ . A larger value means a stronger interaction for those particular changes; zero means no interaction was measured. Blank cells are unmeasured, not zero. These measurements describe sampled changes, not all possible field values or bug counts.

### Graph structure metrics

Each point represents one chart with published graph measurements. The upper panel compares vertices with connections. The lower counts independent loops after ignoring connection direction: connections minus vertices plus disconnected groups. Parallel connections count separately. The axes compress large values while retaining zero. These counts describe graph structure, not execution loops, runtime or the number of defects.

### Output-space PCA

The panels pool bounded reference measurements from the charts in this report. Colors identify chart numbers in the key below. Both panels use one PCA fit and identical axis limits; axis percentages show variance retained in the encoded features. Resource identities, structure and typed field values enter 256 signed hash bins; numeric values use a signed log transform, and bins are standardized before PCA. Hash collisions and projection can overlap distinct manifests. One observation represents one measured configuration, including repeated outputs. References use schema-valid Boolean flips, adjacent integers and joint changes from the supplied baseline; they do not enumerate the full input or output space. Path scans use recorded retained properties. Finite trimming selectors are replayed on the bounded reference, so their sampling floors apply to that reference size. Runtime rejection, equivalence reuse and failure expansion are not reconstructed. Failed renders have no coordinate. Missing or unfinished measurements do not imply zero variation. With no trimming, the two panels show the same reference sample.

## Appendix: finding codes

HH codes identify finding categories. Numbered E entries, when present, identify recorded diagnostics. Severities below are defaults; configured overrides are shown with the findings above.

### HH1107 - Empty resource bundle

Default severity: **error** | Category: manifest | Evidence type: violation

The active test requires resources but this configuration renders none.

Suggested action: Check resource activation; ignore this contract if an empty chart is intentional.

### HH2001 - Undocumented values path

Default severity: **warning** | Category: values | Evidence type: warning

The audit finds a values path with no matching schema declaration.

Suggested action: Document the path in values.schema.json, including its accepted values.

### HH2006 - Opaque object schema

Default severity: **warning** | Category: values | Evidence type: warning

An object permits unspecified entries without named fields, patterned fields or a typed map-value schema.

Suggested action: Describe fields with properties, patternProperties or typed additionalProperties. Ignore [HH2006](#) for intentional free-form configuration; tests still sample those values.
